

My Egg Speriment

Question - what does acid do to your teeth?

Method- we got three jars put water in one jar the other was fizzy drink the other one vinegar into each jar we put egg shells.

Result- the vinegar one broke down the egg shell the water one stayed the same as did the fizzy drink

Conclusion- egg shells are made of calcium the same as our teeth vinegar is made of acid which destroys

calcium. When we eat sugar bacteria in our mouth produce acid which break down teeth ●
